Overview

Haat_Bazar is a digital agricultural marketplace bridging farmers directly with consumers and wholesalers. It eliminates exploitative middlemen while managing logistics and ensuring fair pricing through transparent fees and minimum order quantities (MOQs).

Problem Statement

Farmers lose up to 50% of their profit margins to traditional intermediaries (Beparis, Aratdars). Conversely, buyers suffer from high market prices and a lack of transparency. Simultaneously, micro-purchasing leads to unsustainable logistic costs, making direct farm-to-consumer sales economically unviable without order threshold constraints.

Objectives

1. **Direct Sales:** Enable farmers to sell harvest batches directly at fair market prices.
2. **Fair & Transparent Pricing:** Provide consumers and wholesalers with fresh produce at transparent costs.
3. **Logistics Viability:** Ensure platform and logistics profitability by enforcing Minimum Order Quantities (MOQs).

Constraints

- **Digital Literacy:** Low technical familiarity among the primary farmer persona.
- **Infrastructure:** Unreliable internet connectivity in rural targeted areas.
- **Timeline:** Strict 2-month MVP development window.

Target Personas

1. Farmer (Key Persona)

- **Type:** Primary Supplier
- **Description:** Rural agricultural producers who need an accessible, low-friction way to list their harvest batches without complex digital hurdles or heavy text input.

2. Consumer (B2C)

- **Type:** Buyer
- **Description:** Urban household buyers looking for fresh, traceable, and affordable groceries directly from rural farms.

3. Wholesaler (B2B)

- **Type:** Buyer
- **Description:** Commercial institutions (restaurants, grocers) looking to purchase bulk crops at tiered wholesale rates with predictable fulfillment.

Key Use Cases & Scenarios

Scenario 1: Farmer Listing Process

A farmer lists a 500kg batch of potatoes to be harvested next week using localized voice-to-text input and an icon-based UI designed for low digital literacy.

Scenario 2: Consumer Purchase & MOQ Guard

An urban consumer attempts to check out with 1kg of tomatoes. They are prompted by the system's **MOQ Guard** to meet the 5kg minimum basket weight. The consumer adds 4kg of potatoes to satisfy the constraint and completes the order.

Scenario 3: B2B Wholesale Purchase

A restaurant owner (Wholesaler) browses the marketplace, bypasses standard consumer MOQs due to their verified B2B status, and directly purchases 200kg of potatoes from a farmer's listing.

Scope & Requirements

Features In (MVP)

[M] denotes a minimum viable experience requirement for MVP.

- **[M] Farmer Registration & Simplified Listing:** Icon-heavy, voice-assisted flow for listing upcoming harvest batches.
- **[M] Consumer/Wholesaler Portal:** Tailored e-commerce interfaces designed for B2C and B2B user paths.
- **[M] Dynamic MOQ Engine (MOQ Guard):** Cart and product-level threshold restrictions to prevent micro-purchasing logistics losses.
- **[M] Transparent Fee Calculation Engine:** Dynamic pricing formula breakdown (`Base Price + Service Fee + Delivery`).
- **[M] Escrow & Payment Gateway Integration:** Mobile Financial Services integration supporting bKash and Nagad.
- **[M] Hub Verification Module:** Basic scanning tools for inventory intake, grading, and weight verification at physical collection points.

Features Out (Deferred to v2+)

- **Complex Social Group Buying:** Enabling neighboring consumers to pool orders together (Deferred to v2).
- **AI-based Crop Disease Scanning:** Image recognition for automated crop health diagnostics (Out of scope).
- **Custom Predictive Market Pricing Models:** Dynamic supply-demand automated pricing will be replaced by simple farmer-set base pricing for v1.

Technical & Design References

- **Design (Figma):** 🗋 File *(Link to Figma mockups - TBD)*
- **Technical Specifications:** 🗋 File *(Link to Haat_Bazar System Architecture & Microservices Specifications)*
- **Core Architecture Stack:**
    - Backend: Python / Django
    - Database: PostgreSQL (with PostGIS extension)
    - Mobile Clients: React Native
    - Key Architecture Requirement: Offline-first state synchronization for the Farmer Mobile Application.

Go-To-Market (GTM) Strategy & Success Metrics

Success Metrics

1. **Farmer Onboarding:** 100 farmers successfully onboarded and actively listing crops in the pilot district.
2. **Basket Size:** Average B2C basket size consistently exceeds the 5kg threshold.
3. **Payout Reliability:** 99% payout success rate to farmers within T+1 days following physical hub verification.

GTM Approach

Pilot launch in a single semi-urban district (e.g., Dhaka outskirts). Physical hub infrastructure will be established first, followed by farmer acquisition via local field agents. Consumer acquisition will target urban households through localized social media campaigns emphasizing *"Direct from Farm, Fair Prices."*

Risk Management & Open Issues

Open Issues

1. Securing scalable last-mile delivery partner agreements.
2. Finalizing the physical hub locations for the initial pilot phase.

Q&A Log

- **Question:** What happens if a buyer rejects the produce at the door? *(Asked by Engineering Lead)*
- **Answer:** The Hub Verification process guarantees quality (Class A/B/C) prior to dispatch. Doorstep rejections trigger a dedicated platform review process, but the farmer is paid upon physical Hub verification to protect them from downstream buyer remorse.

Execution Plan

Feature Timeline & Phasing

Feature / Milestone	Status	Target Completion Date
Core Backend & DB Schema	In Development	Oct 30, 2026
MOQ & Pricing Engine	Backlog	Nov 10, 2026
Farmer App (MVP UI)	Backlog	Nov 20, 2026

Feature / Milestone	Status	Target Completion Date
Buyer App & Checkout	Backlog	Nov 30, 2026
Payment & Hub Module	Backlog	Dec 13, 2026
